

# Buildings and Storage

**Natalia Wisniewska**  
**Joseph Juan**  
**Akash Goenka**  
**Lara Tarasewicz**  
**Mauricio Riveros**  
**Matteo Silvestri**

# Introduction

# Assessing policy measures for energy efficiency in UK homes

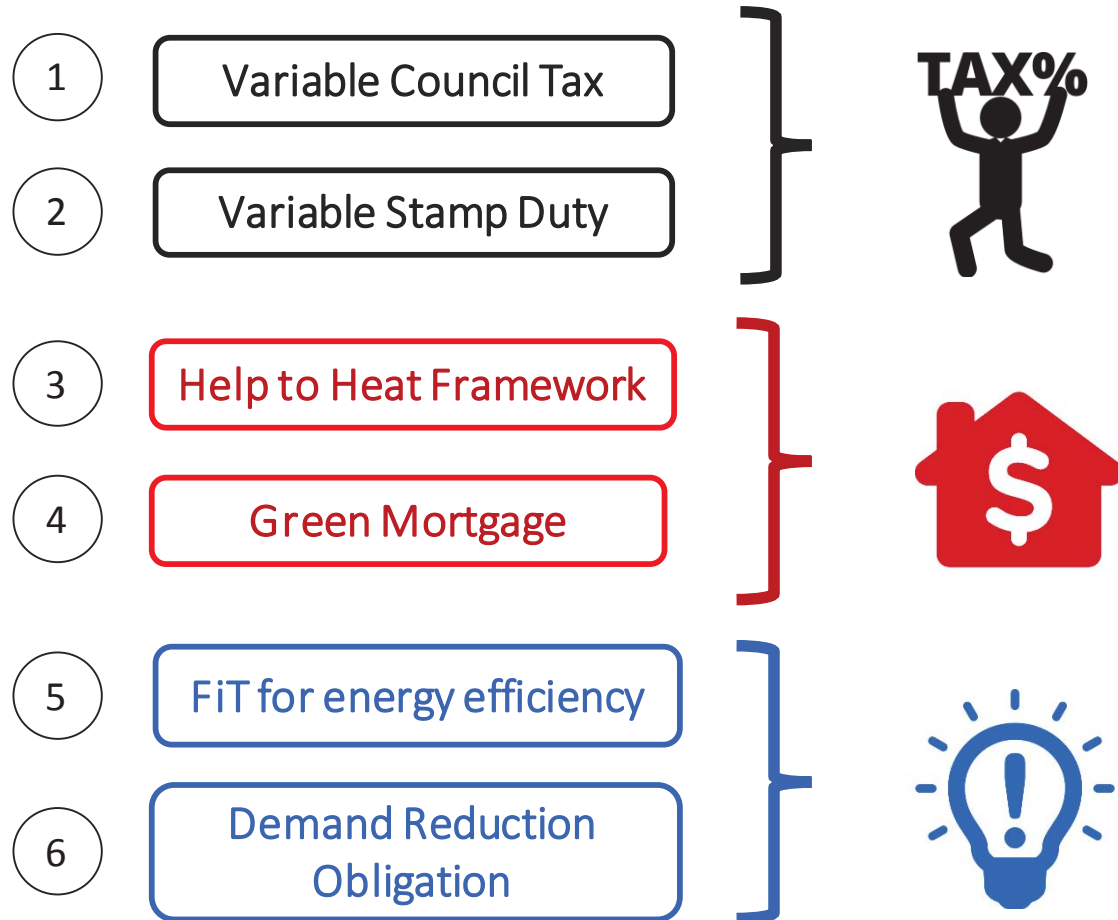

**Natalia Wisniewska**

# How to boost energy efficiency in domestic households?

# Which policy could achieve that?

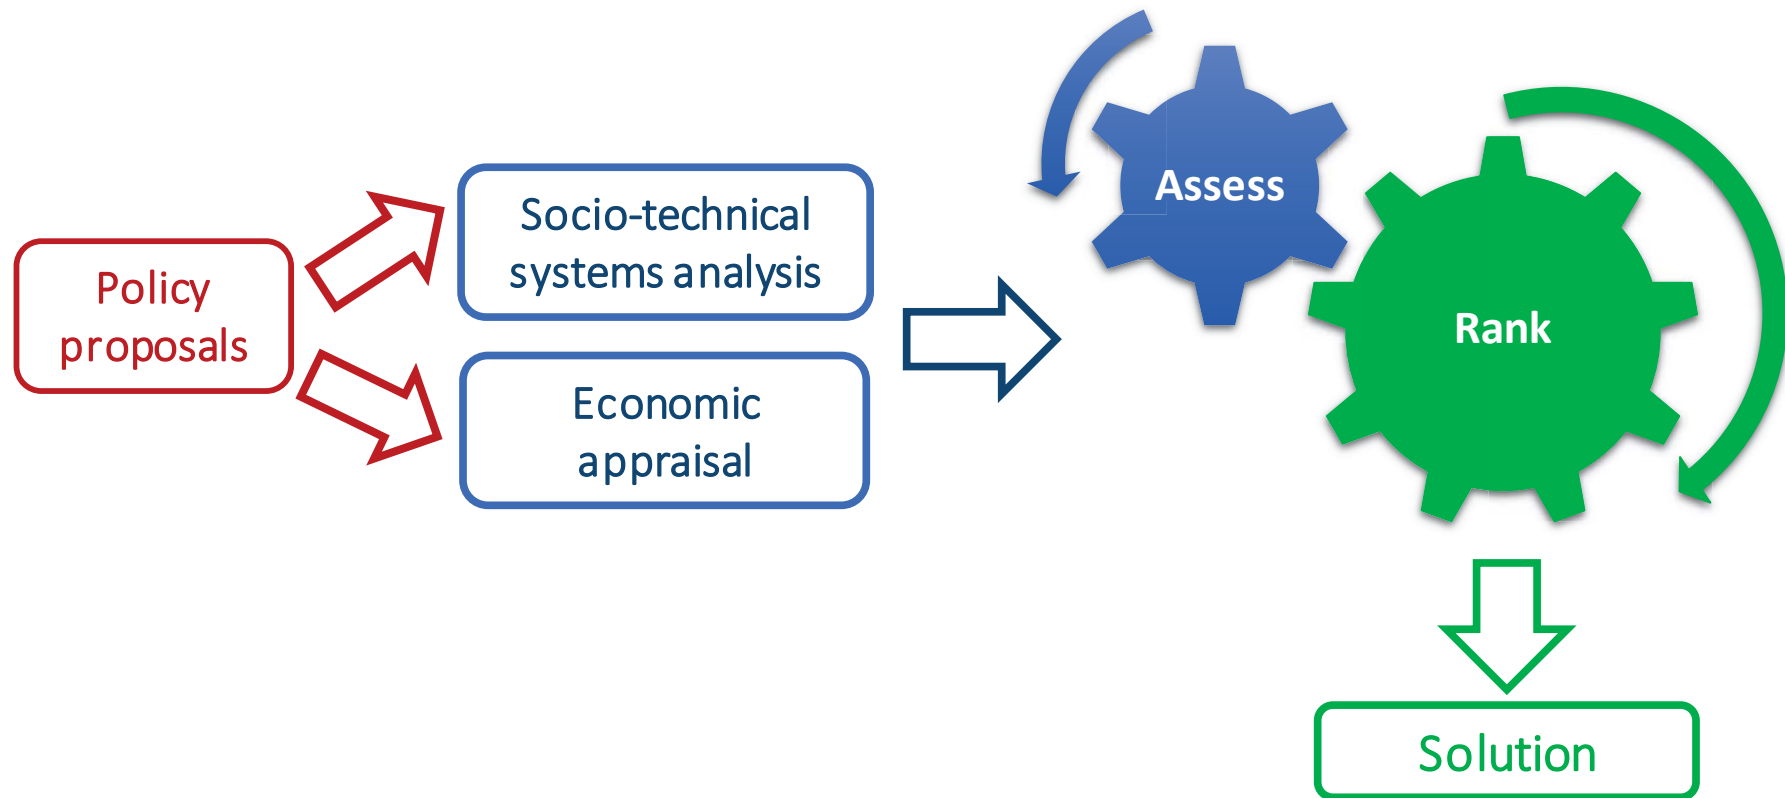

How to assess the potential of policy  
prior to its launch?

# Policy assessment tool

# Solution: what will work?

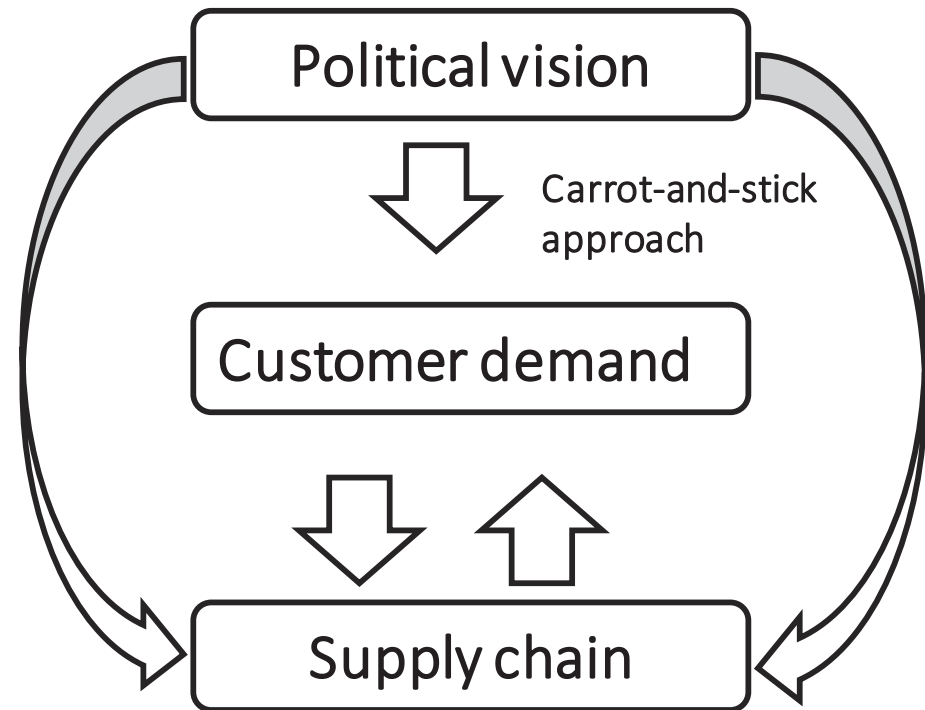

Variable Council Tax

Green Mortgage

Variable Stamp Duty

# POSTER 18

My sincere thanks to my supervisors Chris Mazur, Jeff Hardy and James Luger, but also Simon McGreehin, my interviewees and everyone else who supported this work.

# Solar-Combined Cooling, Heating and Power (S-CCHP) *A Techno-economic Assessment*

Joseph Juan

# Polygeneration Energy System

Focus on **combining cooling and power** part, called as **solar combined cooling and power (S-CCP) system**:

**Aim:** To assess the **technical** and **economic** feasibility for a **typical house in London**

# System Performance

**System performance**

**The amount of electricity saving**

**The amount of electricity demand coverage**

**Control strategies**

**System Performance**

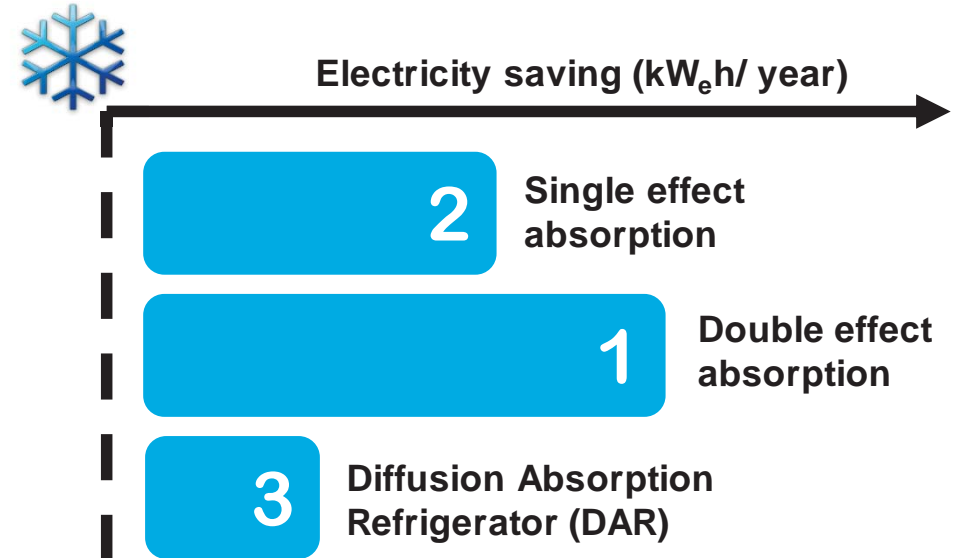

# System Combinations

**Which combinations give higher electricity saving?**

# Results: Technical Assessment

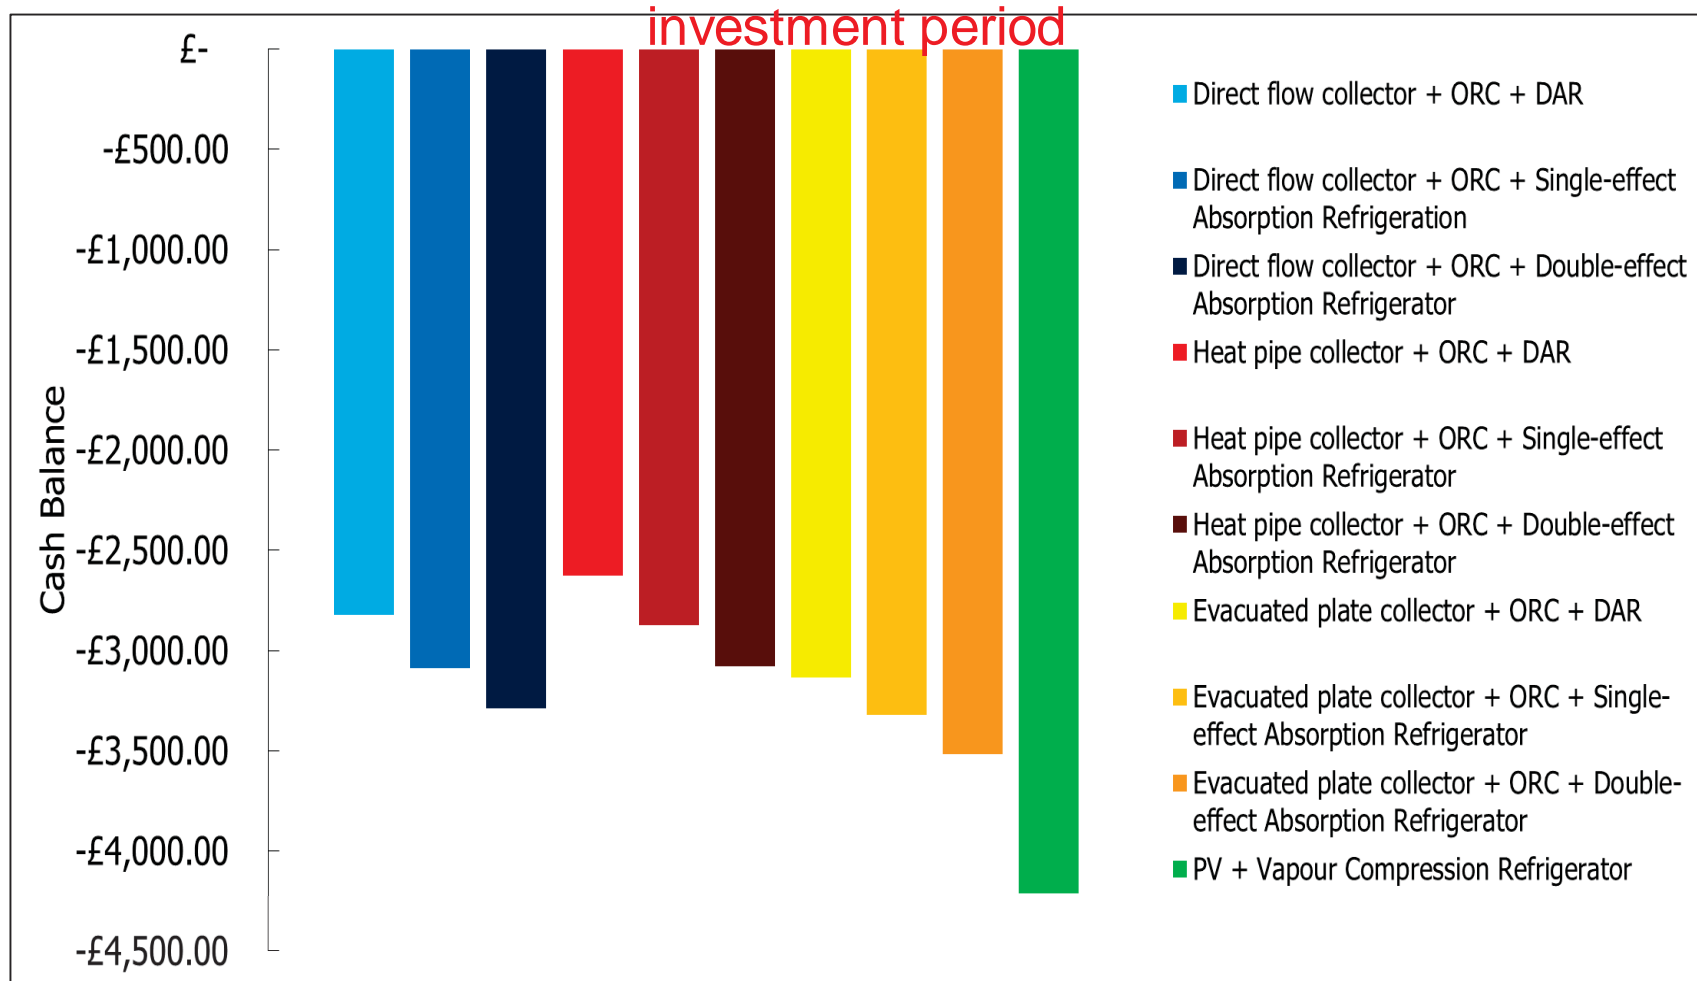

However, the systems only cover **5 – 12% annual electricity demand** because of the **low solar resource in London**

# Results: Economic Assessment

## Net present value of S-CCP system after 20 years

# Conclusions

- The considered **solar combined cooling and power (S-CCP) system is not feasible** to provide energy for a **typical house in London**
- However, **installing the system in sunnier location** or **applying hybrid system** can be considered further

# POSTER 16

My sincere thanks to Dr. Christos Markides, Dr. Antonio Marco Pantaleo, Dr. Robert Edwards and James Freeman for their valuable helps in this project.

# A Design Environment to Enable Smart Buildings

**Akash Goenka**

# Setting the scene

- Can the enormity of energy consumption by buildings be ignored?
- Why do buildings underperform (energy-wise)?

# Turn up the heat!

- Takes note and learns your schedule
  - 7 am: A warm welcome
  - 8 am: Off to work
- Slashes bills and energy use
- This is *smart!*

# Aim

*What is the impact of controls on HVAC energy consumption and indoor comfort?*

# The Faculty Building model

Trench heaters

Chilled Beams

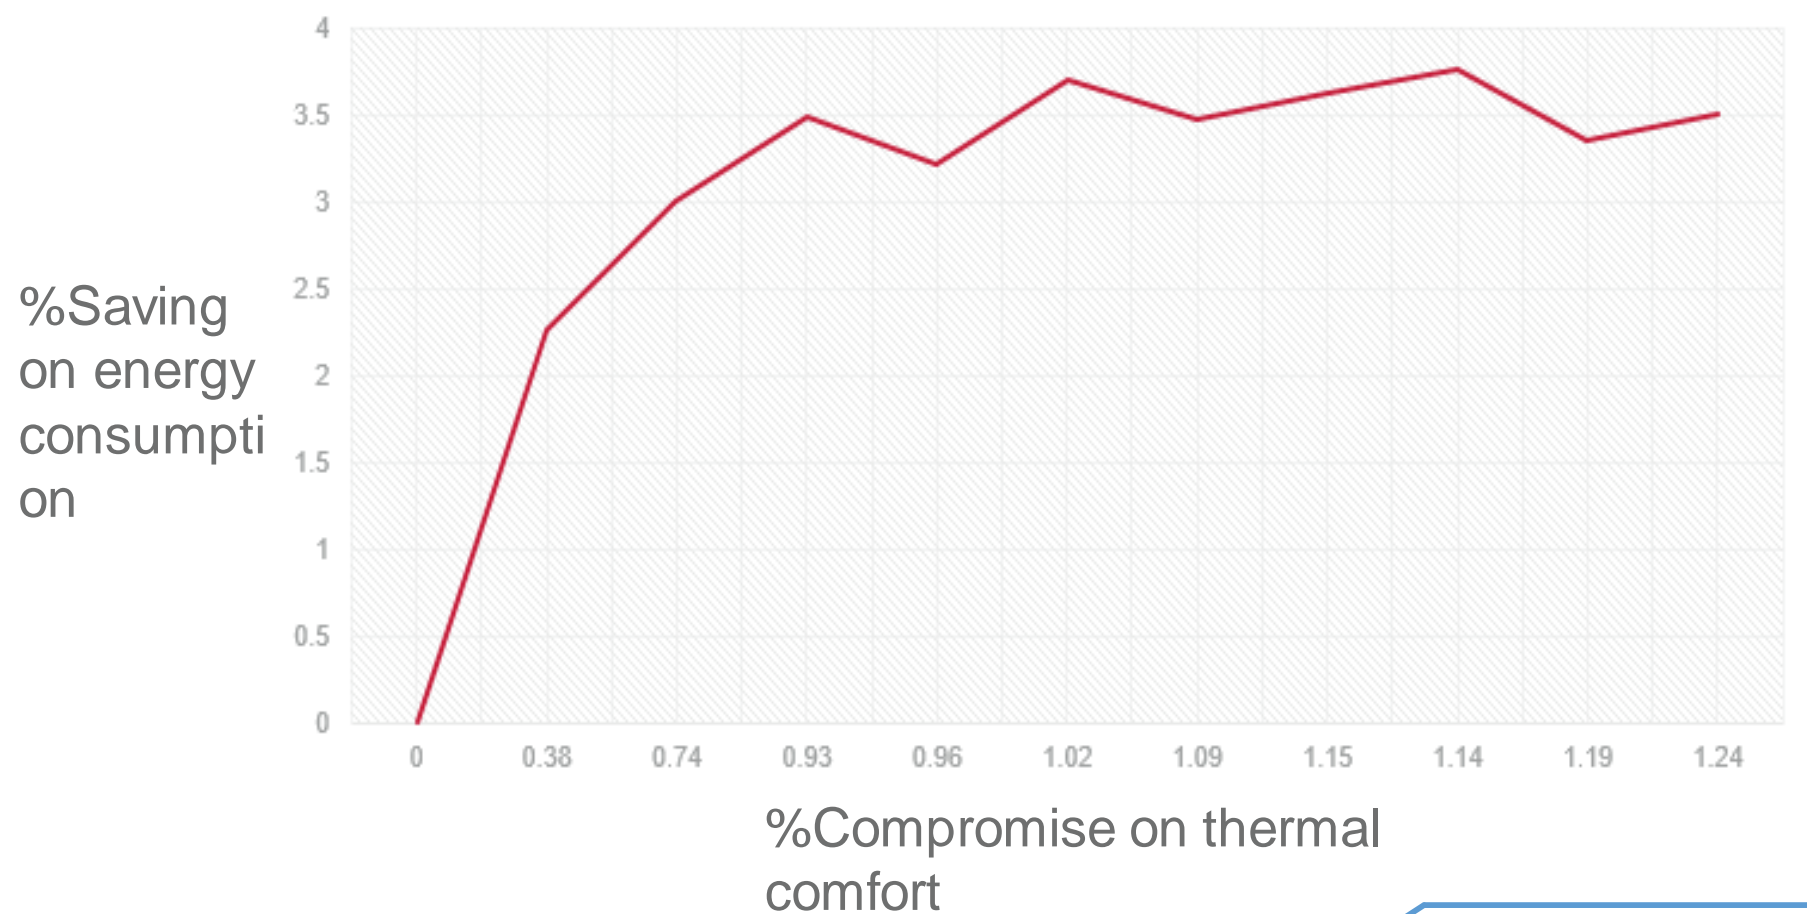

# A 3D Reconstruction

# Simulation Results

- Greater thermal com  $\leftrightarrow$  Greater energy consumption

# POSTER 15

My sincere thanks to my supervisors, Dr Bianca Howard,  
Dr Salvador Acha and Prof John Polak.

## An Olympian Challenge:

How do we address retrofitting  
commercial buildings?

Lara Tarasewicz

# Focus: Soft Barriers

Overcome soft barriers to retrofitting

Commercial Buildings

Energy Efficient

# Why do soft barriers matter?

We have the technology...

E.g. Insulation, LED lighting

So why aren't all commercial buildings energy efficient yet?

# Novel Methodology

INPUTS

ECONOMIC &  
Carbon

SOCIO-TECHNICAL  
SYSTEMS

# General Case → Case Study

## General Case

### 38 barriers

1. Split Incentives
2. Management
3. Business case

### 17 Solutions, e.g.

- Individual Responsible
- Demonstration Example
- Finance Team Lead

## Key Findings

# Key Findings

## POSITIVES

Motivated individuals

Good communication

SSD support

Methodology:

Toolkit of Barriers and Solutions

## NEEDED

Assurance on energy savings

Payback > 3 years

Government policy

# POSTER 17

My sincere thanks to my supervisors Dr Christoph  
Mazur,  
Dr Koen van Dam and Pelumi Solaru.

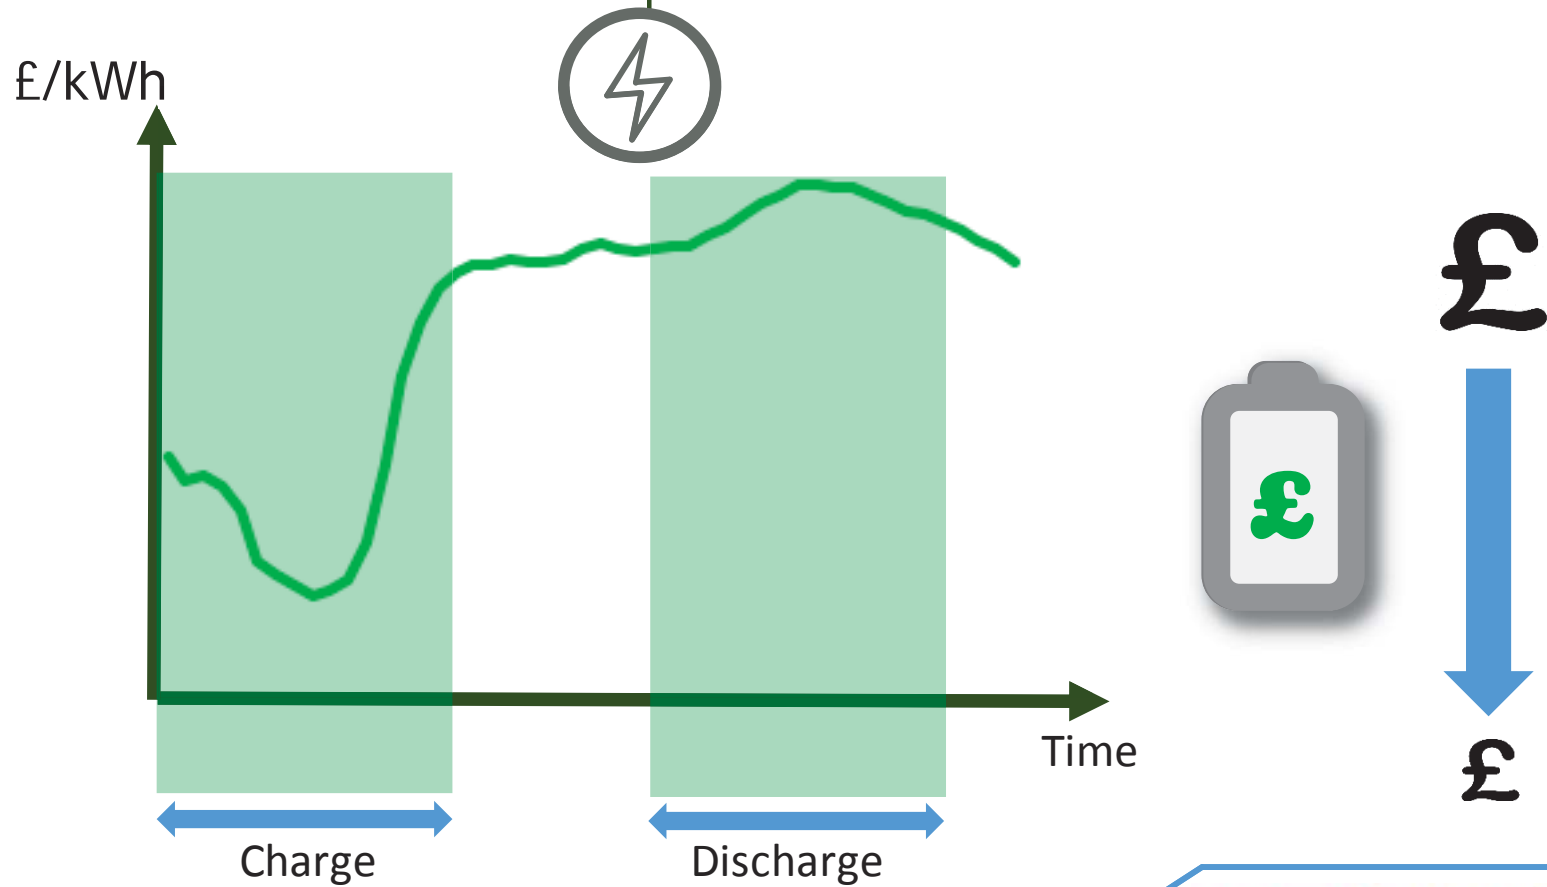

# Carbon Arbitrage with Electrical Energy Storage

**Mauricio Riveros**

# Arbitrage

# Arbitrage

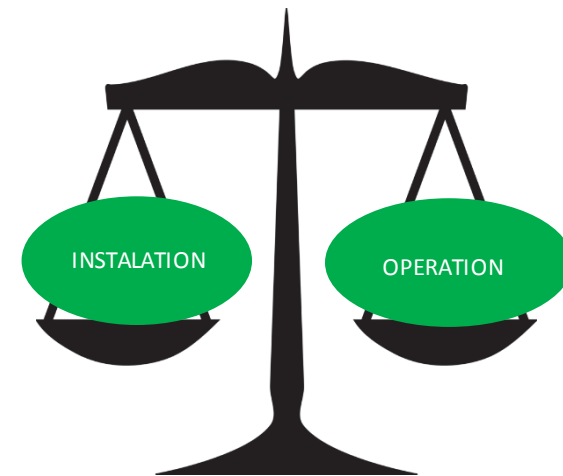

# Arbitrage

tCO<sub>2</sub>/kWh

# Methodology

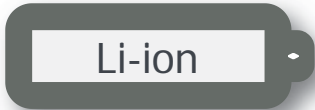

Optimization Problem

# Case Study

## Technology

## Generation Mix

Mix 2015

50% Wind

80% Nuclear

## Distributed Generation

DG-1

DG-2

# Results: Emissions Savings

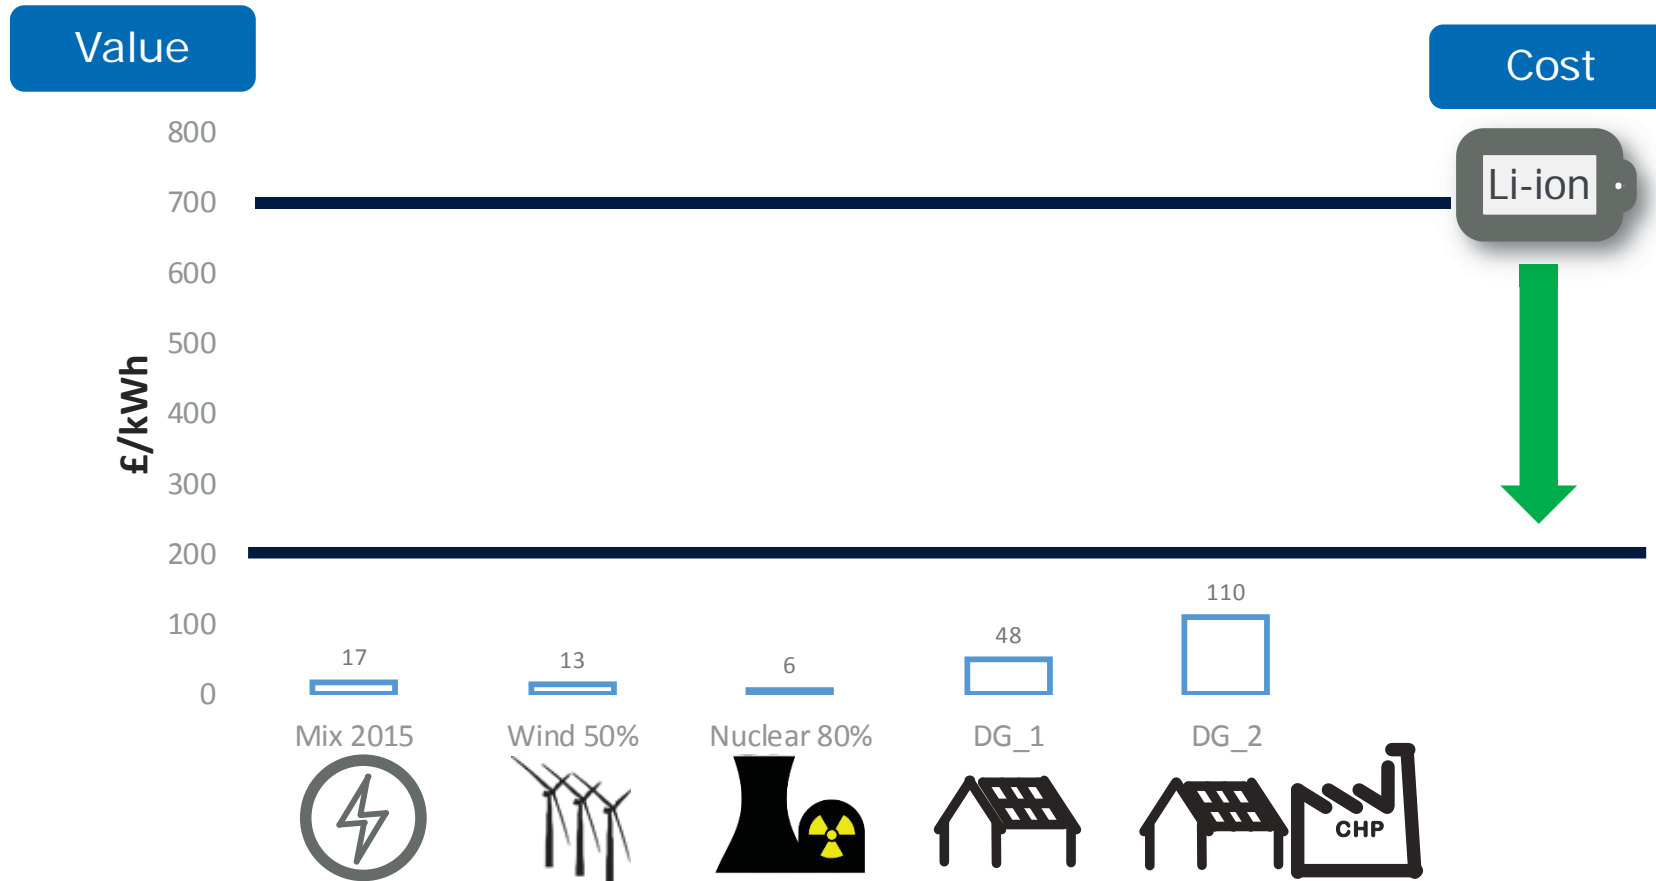

# Results: Is it profitable?

£

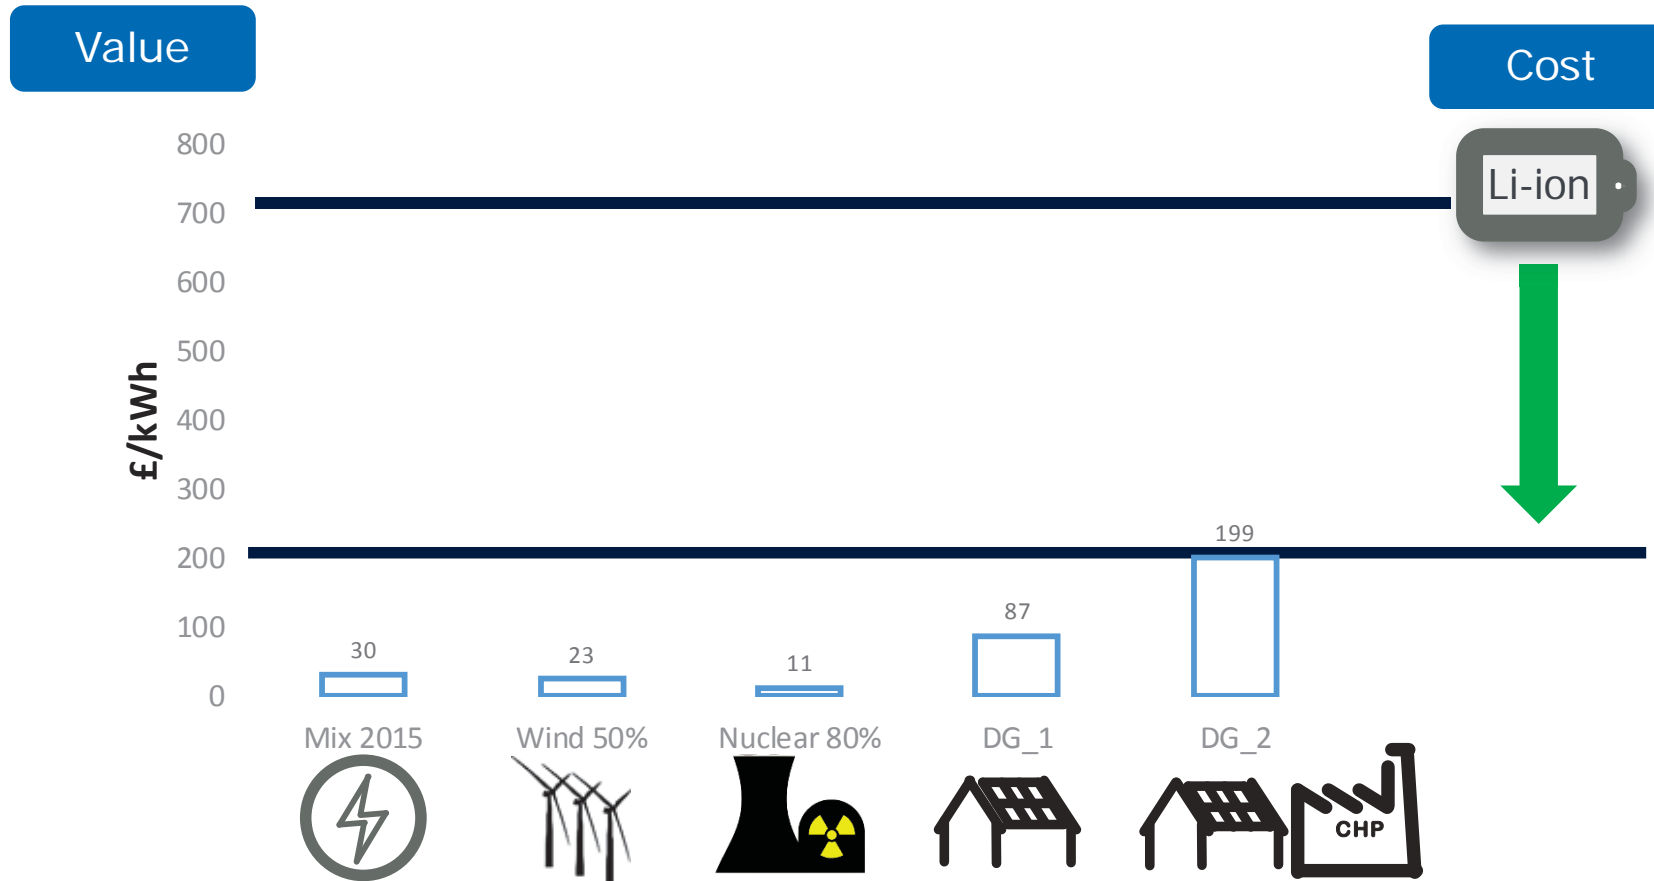

117  
£/tCO<sub>2</sub>

Price forecasted for the UK  
more optimistic case in 2030

# Results: Is it profitable?

# Conclusions

- A **significant capacity** is needed to maximise the savings in all the scenarios studied.
- **Savings are mainly defined by the carbon intensity** of the grid more than the demand patterns.
- The **emissions reduction is not high enough** to pay the investment at the current carbon price and investment costs.
- That suggest the need to **mix the Carbon Arbitrage with another application** to increase the value.

# POSTER 19

My sincere thanks to my supervisors Dr Miao Guo,  
Dr Koen Van Dam, Professor Nigel Brandon and Gonzalo Bustos.

# The value of energy storage for industrial sites in the UK

**Matteo Silvestri**

## Battery cost vs. benefits

## Electricity Price

**Can a battery system generate net savings on the electricity bills?**

# Electricity Bill: Saving Opportunities

## Transmission Charge

$$£ = \frac{£}{kW} * kW$$

Regional tariff

Power demand during the 3 annual half hours of highest national demand

## Intra-day Arbitrage

# Case Study

## Industrial Site

GlaxoSmithKline

Barnard Castle  
Durham County

## Battery Technologies

## Electricity Pricing Scenarios

Different combination of trends for:

- Transmission tariff
- Distribution tariff
- Volatility of electricity price

# Results

## Net Savings on Electricity Bill

## Share of savings for Li-ion and FB

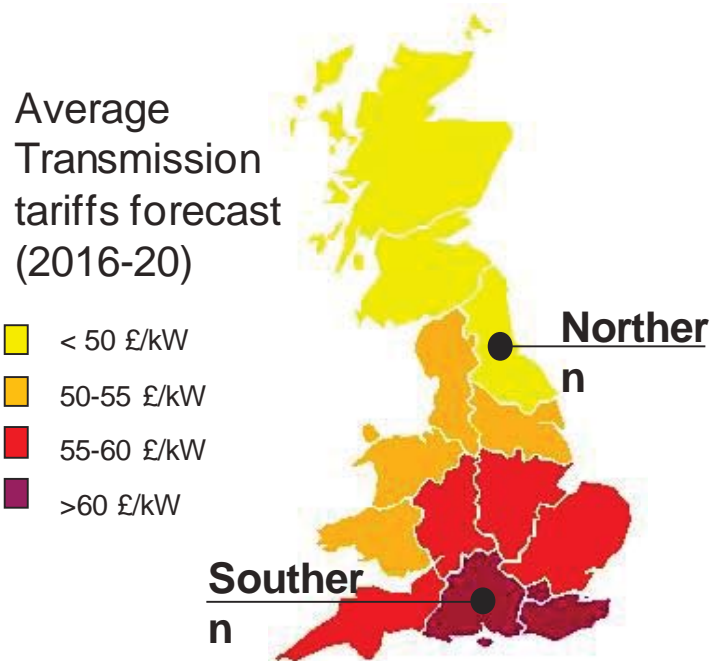

Optimal battery size:  
energy/power  
capacities ratio  $\approx 0.5$   
hours

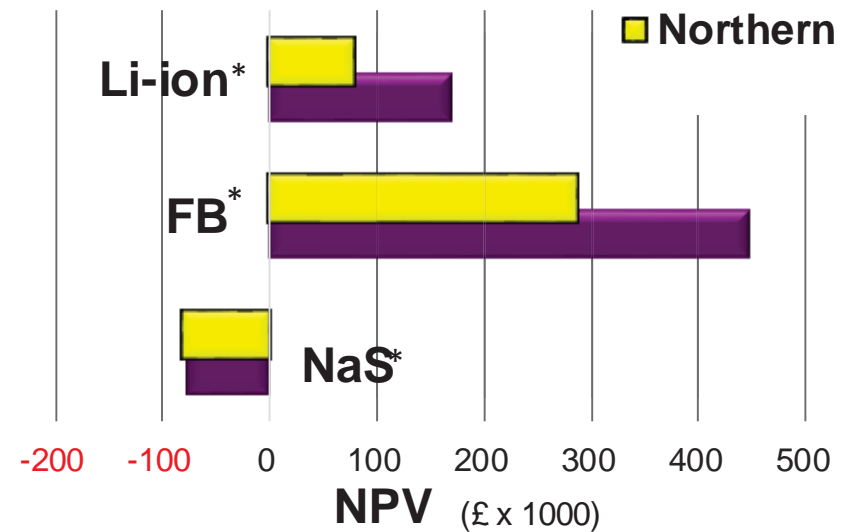

# Sensitivity Analysis

## Transmission Charges Regional Variation

## Effect on Net Present Value

(\*) Technologies not to be compared each other due to different lifetimes

# Conclusions

There is a business case for properly designed and operated battery systems considering just the savings on electricity bills

# POSTER 20

My sincere thanks to my supervisors  
Professor Nigel Brandon and Mr. Adrien  
Lebrun.

**Thank you!**

**Natalia**

**18**

**Joseph**

**16**

**Akash**

**15**

**Lara**

**17**

**Mauricio**

**19**

**Matteo**

**20**
