Chemistry II (Organic)

Heteroaromatic Chemistry LECTURE 8

Diazoles & diazines: properties, syntheses & reactivity

Alan C. Spivey a.c.spivey@imperial.ac.uk

Imperial College London

Mar 2012

Format & scope of lecture 8

• Diazoles:

- Imidazole & pyrazole
- Structure & properties
- Synthesis
- Reactivity

• Diazines:

- pyrimidines, pyrazines & pyridazines:
- structure & properties
- syntheses
- reactivity

Diazoles: Imidazoles & Pyrazoles – Importance

Diazoles can be considered as related to pyrrole but containing an additional N in place of one CH group:

- For a recent theoretical discussion of pyridine- vs. pyrrole-like Ns in imidazole see: Richaud Org. Lett. 2011, 972
 [DOI]
- Imidazole and pyrazole are both NH-acidic (pK_as 14.5 & 14.2 respectively; cf. pyrrole 17.5). The basicity of the pyridine-like N varies significantly:
 - *imidazole* is a stronger base than pyridine whereas *pyrazole* is a weaker base than pyridine:

Imidazole and pyrazole – Structure and Properties

- *Imidazole:* colourless prisms, mp 88 °C; *pyrazole:* colourless needles, mp 70 °C
- **Bond lengths** and ¹*H NMR chemical shifts* as expected for aromatic systems: bond lengths:

- Resonance energies: both systems have lower resonance energies than pyrrole (*i.e.* <90 kJmol⁻¹)
- Electron density: relative to pyrrole, the additional (electronegative) N atom decreases the overall electron density on the remaining carbons. The precise distribution is rather uneven:
 - □ for *imidazole*: C4 & C5 are *electron rich*, C2 is *electron deficient*
 - for pyrazole: C4 is electron rich, C3 & C5 are electron deficient

- \square \rightarrow both *pyrazole* and *imidazole* are:
 - significantly *less reactive* towards electrophilic aromatic substitution (S_EAr) than pyrrole (<u>but</u> >benzene)
 - reactive towards nucleophilic aromatic substitution (S_NAr) at certain C s (*cf.* pyrrole which does <u>not</u> react with nucleophilies)

Imidazoles:

 \Box <u> α -haloketone</u> with <u>amidine</u>:

$$\begin{array}{c} \stackrel{\oplus}{\longrightarrow} N \stackrel{\oplus}{\longrightarrow} R \\ \stackrel{\oplus}{\longrightarrow} R \\$$

<u>1,2-dicarbonyl</u> & an <u>aldehyde</u> with <u>NH₃</u>:

$$\stackrel{0}{\to} \stackrel{0}{\to} \stackrel{0$$

- Pyrazoles:
 - <u>hydrazine</u> with <u>1,3-dicarbonyl</u>:

In <u>1,3-dipolar cycloaddition</u> of <u>diazoalkane</u> with <u>alkyne</u>:

$$\begin{array}{c} R & C & R \\ & & R \\ & & & \\ R' & & \\ R' & & \\ \end{array} \xrightarrow{A} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & & \\ R' & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & \\ R' & \\ \end{array} \right]^{\#} \left[\begin{array}{c} R & R'' \\ & \\ R' & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & \\ R' & \\ \end{array} \right]^{\#} \xrightarrow{R} \left[\begin{array}{c} R & R'' \\ & \\ R' & \\ \end{array} \right]^{\#} \left[\begin{array}{c} R & R'' \\ \\ & \\ R' & \\ \end{array} \right]^{\#} \left[\begin{array}{c} R & R'' \\ \\ \\ R' & \\ \end{array} \right]^{\#} \left[\begin{array}{c} R & R'' \\ \\ R' & \\ \end{array} \right]^{\#} \left[\begin{array}[c] R & R' \\ \\ R' & \\ \end{array} \right]^{\#} \left[\begin{array}[c] R & R'' \\ \\ R' & \\ \end{array} \right]^{\#} \left[\begin{array}[c] R & R'' \\ \\ R' & \\ \end{array} \right]^{\#} \left[\begin{array}[c] R & R'' \\ \\ R' & \\ \end{array} \right]^{\#} \left[\begin{array}[c] R & R'' \\ \\ R' & \\ \end{array} \right]^{\#} \left[\begin{array}[c] R & R' \\ \\ R' & \\ \end{array} \right]^{\#} \left[\begin{array}[c] R & R' \\ \\ R' & \\$$

Electrophilic substitution: via addition-elimination (S_EAr):

- **<u>reactivity:</u>** reactive towards many electrophiles (E+); >benzene but <pyrrole, furan & thiophene
- **regioselectivity:** substitution at <u>electron rich carbons</u> predominate (*cf.* electronic distribution):
 - imidazole: C4 > C5 (for NR systems; if NH then C4 and C5 are identical)
 - pyrazole: C4 less reactive than imidazole

NB. electron donating substituents enhance reactivity towards electrophiles

Imidazoles and pyrazoles – Reactivity cont.

- Nucleophilic substitution: via addition-elimination (S_NAr)
 - **reactivity:** reactive towards good nucleophilies (**Nu**⁻) provided leaving group is situated at appropriate carbon
 - regioselectivity: substitution of leaving groups (e.g. Cl, Br, NO₂) at <u>electron deficient centres</u> possible (cf. electronic distribution):
 - imidazole: C2 relatively reactive centre
 - pyrazole: C5 ~ C3 neither centre very reactive

- e.g. displacement of Br by amine: $(Nu^2 = R_2N^2, LG = Br)$
 - imidazole:

NB. electron <u>withrawing</u> substituents enhance reactivity towards <u>nucleophiles</u>

- Metallation: (imidazole NH $pK_a = 14.5$; pyrazole NH $pK_a = 14.2$)
 - deprotonation by strong bases more facile than for pyrrole ($pK_a = 17.5$) or indole ($pK_a = 16.2$):

NB. thermodynamic deprotonation ortho to 'pyrrole-like' rather than 'pyridine-like' nitrogen (see Lecture 7)

Diazines: Pyrimidines, Pyridazines & Pyrazines – Importance

Natural products:

Diazines can be considered as related to pyridine but containing an additional N in place of one CH group:

in all cases the 'new' *N* is *pyridine-like*, *i.e.* this *N* contributes just 1 electron to the aromatic π-system and has a *basic lone pair* in the sp² orbital in the plane of the ring:

pyrimidine

pyrazine

pyridazine

□ All three diazines are significantly *less basic* than *pyridine:*

pyrimidine (pK_a 1.3)

pyrazine (pKa 0.4)

pyridazine (pK_a 2.3)

Diazines – Structure and Properties

- Pyrimidine: colourless prisms, mp 22 °C
- Pyridazine: colourless liquid, bp 208 °C
- Pyrazine: colourless prisms, mp 57 °C
- Bond lengths and ¹H NMR chemical shifts as expected for aromatic systems:

Resonance energies: all three systems have lower resonance energies than pyridine (117 kJmol⁻¹)

- □ → susceptible to nucleophilic <u>addition</u> reactions
- Electron density: all three systems are highly electron deficient (cf. ~pyridine)
 - □ → *unreactive* towards *electrophiic substitution* (S_EAr)
 - $\square \rightarrow$ *reactive* towards *nucleophilic substitution* (S_NAr)

Diazines – Syntheses

Pyrimidines:

• Pinner: <u>1,3-dicarbonyl</u> with <u>amidine</u>

Pyrazines:

dimerisation of α -aminoketone/aldehyde then aerial oxidation:

$$\begin{array}{c} R \\ H_{2} \\ H_$$

Pyridazines:

• 'Paal-Knorr': 1,4-dicarbonyl with hydrazine

NB. hydroxyl 'leaving group' in 1,4-dicarbonyl obviates oxidation

- Electrophilic <u>addition</u> at N:
 - formation of *N-oxides* as for pyridine; these derivatives are more susceptible to S_NAr (and S_EAr) than the parent diazines:

Electrophilic <u>substitution</u>: via addition-elimination (S_EAr)

- □ all diazines are *highly electron deficient* \rightarrow very <u>unreactive</u> towards S_EAr
 - electron donating substituents and/or N-oxides (see above) required to allow reaction even at C5 of pyrimidine:

<u>regioselectivity</u>: via most stable Wheland intermediate

Diazines – Reactivity

- *Nucleophilic substitution: via* addition-elimination (S_NAr)
 - all diazines are *highly electron deficient* \rightarrow very <u>reactive</u> towards S_MAr (>pyridines)
 - all halodiazines except 5-halopyrimidines react readily with nucleophilies:

C4 & C2 pyrimidines

C4 & C3 pyridazines

C2 pyrazines

C5 pyrimidine

Metallation:

all diazines can be metalated *ortho* to **N** by LiTMP (pyrimidine at **C4** not **C2**):
